### CWE Market Coupling Implementation Study

Dear trading participants,

In early August 2008, the partners of the CWE Market Coupling project have provided the Implementation Study to the PentaLateral Energy Forum.

This reference document describes the design of the market coupling solution that is proposed to be implemented. It is a major milestone for the project.

An addendum to the implementation study will be provided by the end of November concerning specific aspects (e.g. the Shipping Agent description, the sharing of congestion revenue, the description of ATC, a new data bottom-up budget/planning).

Project partners are currently organising the necessary steps to enter the implementation phase. The first target is the launch of an ATC based market coupling for the CWE region, so far foreseen towards the end of 2009. After a time of parallel running in flow-based coupling, there is going to be a final switch to flow-based coupling.

You will find below the Implementation study, as well as its appendices:
